Care Diamonds in Asia
Varieties of Familialism

OCHIAI Emiko (Kyoto University)
Total fertility rates (2004-06)

Lowest low fertility in East Asia

[Bar chart showing fertility rates for various countries, with the Philippines having the lowest fertility rate.]
Proportion of population 65+ (2005-07)
Japan is an exception in Asia
Fertility Decline in Asia and Europe
Compressed modernity in Asia
Age Structure in Asian Societies
Demographic dividend except for Japan
Questions
• Care regimes in contemporary Asia for childcare and elderly care
• The roles of policies in creating care regimes
Theoretical Framework
Key concepts

• Familialism
A familialistic system… is one in which public policy assumes that households must carry the principal responsibility for their family members’ welfare. (E-A 1999)

• Defamilialization= The degree to which individual adults can uphold a socially acceptable standard of living, independently of family relationships, either through paid work or through the social security system (Lister 1994)
Two directions of defamilialization

- Def. by the state and def. through market
- Particularly important in the study of care regimes in Asia Ochiai(2009)
Theoretical framework for this study

• Def. by the state / def. through market
• Def. of service / def. of finance
• Familialism as a social regime
  (not only as a type of social policy)
• Care diamond
  (Adding community to the care triangle as a key to understand changes)
Comparison of Six Asian Societies
“Asian Gender Project”

• Purpose: To reveal family and gender role changes in East and Southeast Asian societies focusing on the patterns of care provision in childcare and elderly care.

• Research areas: China, South Korea, Taiwan, Singapore, Thailand, Japan. (India, Indonesia, Vietnam were added later.)

• Focus: Urban middle class.

• Method: Semi-structured interview supplemented by surveys in some areas.

• Research period: 2001~2003~present.
Research Areas
Background

• Ethnicity: Chinese/Korean/Thai/Japanese
• Religion: Confucianism/Buddhism/Taoism/Shintoism
• Kinship system: Patrilineal/Bilateral/
• Social regime: Capitalism/Socialism

Huge diversity
Gender
Three Types of Female Lifecourse

- Type 1: a high employment rate is maintained (China, Thailand)
- Type 2: a decline starting from the 30s or children’s reaching a certain age (Singapore, Taiwan)
- Type 3: a temporary decline in the late 20s followed by a rise (“M-shape pattern”) (Korea, Japan)
Female Labor Force Participation Rates by Age in Six Asian Societies

Summary of findings

• (1) Relatives are most effective providers of both childcare and elderly care. Chinese and Thai fathers are most active in childcare, while daughter-in-laws are active in Japan and Korea.

• (2) Foreign domestic workers are used in many societies except for Japan particularly for elderly care in Taiwan and both childcare and elderly care in Singapore.

• (3) The institutional childcare is developed in socialist China and developmentalist Singapore for utilizing female labor, while the institutional elderly care is most developed in Japan.
• (5) Various kinds of effective providers for childcare exist in the societies where mothers with small children usually work. (Type 1 and 2 societies, especially China and Singapore), while support networks are poor in the “M-shape” societies where mothers with small children usually stay at home (Type 3 societies, namely Korea and Japan), particularly in Japan.

• (6) The community is officially activated for elderly care in China.
Analysis:
Care diamonds and the roles of policy
Care diamond

- State
- Market
- Family
- Community or voluntary

Care triangle

Care diamond
• For applying this model for Asian societies, the third sector should be renamed as “Family and relatives”.
• Institutional care can be divided into the state sector (public institution) and the market sector (private institution).
• The use of care worker with public subsidies can be partially attributed to the state sector.
The roles of policy in forming care diamonds

• The role of policy is not only related to the provision of care services or financing of care cost by the state.

• The policies also promotes or restricts care provision from other sectors either by financing or by regulation.

Conclusion:
Varieties of Familialism in Asia
Varieties of Familialism in Asia

![Diagram showing the varieties of familialism in Asia with a spectrum from State to Market and Socialization to Commodity. Key points include:

- Socialist smuggling commodification and familialism (C)
- Developmentalist familialism (S)
- Familialism smuggling commodification (Tw)
- Extended familialism (K, Th)
- Familialism (J)

The diagram illustrates the interaction between states and markets, with familialistic practices ranging from socialistic to developmentalist contexts.]
Remaining family responsibility

• Defamilialization through market is well-developed in Asian societies (except for Japan).
• However, in those cases, the financial responsibility remains on the family. (Taiwan, Korea, Thailand)
• There are strong state support for childcare in China and Singapore. But the later cost for education is enormous due to the lack of social investment.
→ low fertility, housewifization
Not only family policy matters

• The activation of market and community by policy
• The significance of the immigration policy in particular
• Long-term care insurance in Japan and Korea
• Legalization of familial care duty in China and Singapore
Different paths in the transformation of care regime

• In European modernity
  Family and relatives + Domestic worker
  → Family (housewife) 1\textsuperscript{st} modernity
  → Family + Welfare state 2\textsuperscript{nd} modernity

• In Asian compressed modernity
  Family and relatives + Domestic worker
  → Family and relatives + FDW* with no period of typical familialization
Figure 2  Fertility and Modernity

First Modernity
50 yrs
Second Modernity

1st Fertility Decline

2nd Fertility Decline
Figure 3  Gender and Modernity

First Modernity  Second Modernity

Housewifization  De-housewifization
• In Japanese half compressed modernity
  Family and relatives + Domestic worker
→ Family (housewife)
  *Consolidated by policies in 1980s

Difficulties in changing the system even after the demographic and economic conditions changed

The Japanese lost decades since 1990s
Conclusion

• The care regimes in Asia are diverse in terms of degree of defamilialization in two directions.

• However, all of them can be called familialism in the sense that they assume family responsibility at least in finance.

• It explains low fertility and the trend of housewifization in this area in spite of availability of care services from relatives and through market.
• Asian care regimes are heavily depending upon commodification of care because Asia was exposed to globalization before the establishment of a closed modern family and with traditional domestic workers still in existence. Commodification of care work took place quickly to fill the gap caused by a lack or insufficiency of the welfare state.
• However, for Japan, where the modern family had barely been established and the government was about to launch a traditional type of welfare state, a quick policy change for commodification of care was difficult (path dependency). The government is seeking for a construction of a moderate welfare state.

• We should consider more the impact of regulations as an explicit tool of familialism and defamilialization.
